                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC The invention relates to human nucleic acids (AAI57798-AAI61369) and CC the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful CC in gene therapy. A composition containing a polypeptide or polynucleotide CC of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and CC localised neuropathies and central nervous system diseases, such as CC Altheimer's, Parkinson's disease, Huntington's disease, amyotrophic C lateral sclerosis, and Shy-Drages, Huntington's disease, amyotrophic C lateral sclerosis, and Shy-Drages, Huntington's disease, amyotrophic CC attivin/inhibin activities such as: Immune system suppression, CC Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic CC and thrombolytic activity, arthritis and inflammation, leukaemias and CC c.N.S disorders.

CC Note: The sequence data for this patent did not form part of the printed CC specification.

                               The invention relates to novel isolated lung small cell cancer antigen cc polynucleotides (I) and polypeptides (II) used in a method of detecting cc cancer in a patient. The method is optionally performed by cutilising oligonucleotides (III), where the biological sample cc from the patient is contacted with (III), detecting the amount of colynucleotide to (III) in the sample and comparing the amount of polynucleotide to a predetermined cut-off value and thereby determining cancer in a patient. (I), (II) or antigen-presenting cells cc expressing (II) is useful for stimulating and/or expanding T cells cc expressing (II) is useful for stimulating and/or expanding T cells cc expressing (II) is useful for stimulations to permit the stimulation cc and/or expansion of the cells. A composition comprising (I) is useful for stimulating an immune response in a patient and for inhibiting the cc development of a cancer especially lung cancer in a patient. An observable and for inhibiting the development of cancer in a patient. Anulog407-AAUG9431 represent novel human lung small cell
                                                                                                                                                                                                                                                                                                                                                                                                                          11-APR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           from the patient is contacted with (III), detecting the amount of polynucleotide hybridised to (III) in the sample and comparing the amount of polynucleotide to a predetermined cut-off value and thereby determining cancer in a patient. (I), (II) or antigen-presenting cells expressing (II) is useful for stimulating and/or expanding T cells specific for a tumour protein. The method comprises contacting T cells with one of the components under conditions to permit the stimulation and/or expansion of the cells. A composition comprising (I) is useful for stimulating an immune response in a patient and for inhibiting the development of a cancer especially lung cancer in a patient. An isolated T cell population is useful for removing tumour cells from the biological sample and for inhibiting the development of cancer in a patient. Anul949407-AAU69431 represent novel human lung small cell cancer antigen amino acid sequences of the invention.

                                                                               cc oligonucleotide comprises at least 15 nucleotides; or (b) a combination co of an oligonucleotide comprises a sequence complementary to the cc complementary strand of a polynucleotide which comprises a 5'-end cc complementary to an oligonucleotide comprising a sequence, where the combination of cc oligonucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of cc oligonucleotide comprises at least 15 nucleotides and the combination of ct the 5'-end sequence3'-end sequence is selected from those defined in cc the specification. The primer sets can be used in antisense therapy and cl quene therapy. The primers are useful for synthesising polynucleotides, cf articularly full-length cDNAs. The primers are also useful for the cdetection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cC cDNAs easily without any specialised methods. AAH03166 to AAH13628 and call sequences; and AAH13629 to AAH13632 crepresent human cDNA sequences; and AAH3679 to AAH13632 crepresent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             29-JUL-1999;

                         polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation, to regulate heematopoiesis; and in
                                                                                                                                                                                                                                                                               Nucleic acids encoding a range of vaccination, testing and therapy

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating tell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA

                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II). The CC considering expressed genes. (I) is useful in gene therapy techniques CC for identifying expressed genes. (I) is useful in gene therapy techniques CC in generating activity of (II) or to treat disease states involving CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical CC imaging of sites expressing (II), (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. (CC The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.
